

THE FUTURE OF PROJECT MANAGEMENT

NESTLER^{CTM} SYSTEM
Project controlling in steel and plant construction | GmbH

NESTLER System The All-In-One Project solution

NESTLER System is a project controlling solution for the international plant construction. It does not interfere with your company's internal IT-Landscape, but supports these as an external solution for single or large-scale projects.

If the customer wishes, however, NESTLER System can communicate with the company's internal systems via predefined interfaces.

The NESTLER System contains different management modules which can be individually adapted to the single projects specific demands. All modules are linked and benefit from each other.

The system's application can be effected dynamically via a unique web-based database, which can be accessed from any place at any time. In this database all basis data and target states are registered and administered centrally by the NESTLER System GmbH's specialized employees.

The online platform 'NESTLERweb' as well as the database barcode scanners combined with the system barcodes constitutes the engineers', suppliers' and assemblers' work equipment. With these simple and effective tools all current actual states regarding construction plans, parts and documents can be retrieved, transmitted and exchanged.

Permanent target-actual comparisons during all activities ensure that changes in drawings, production and delivery as well as their direct effects on all areas are saved in real time and reliably communicated to all parties involved in the project.

Plan management, creating material and component documentation, quality assurance and component logistics require a high investment regarding time and cost for large-scale projects. This can be reduced by logical processes in NESTLER System to a minimum.

THE FUTURE OF PROJECT MANAGEMENT

NESTLER^{CTM} SYSTEM
Project controlling in steel and plant construction | GmbH

The internal messaging system offers the highest data security in your project. The System distributes and forwards all data, documents and information according to workflows. All parties involved in a project can, depending on their access authorization, review, forward or print the documents, drawings, and components as well as their links via NESTLERweb. This guarantees that everyone involved in the project is always up-to-date.

All project documents are administered methodically and can be equipped with a system barcode if required. NESTLER System furthermore offers you an optimized tool for supply-chain management. It displays the entire production process of products and components starting with the receipt of the raw material, followed by the controlled cutting, the assembly and the coating on the respective production site at home or abroad.

All required work steps are registered via scan and are available to everyone involved (depending on authorization) for assessment immediately and in a demand-oriented way.

NESTLER System enables the user to generate uniform + standardized delivery documents (delivery notes with barcode) for all components. All important information on the components, such as the produced resp. delivered revision status, dimensions of the delivery and QA information are shown.

All goods receipts are centrally registered via NESTLER System delivery notes and the parts are booked on their respective storage places on the construction site or intermediate storages with the barcode scanner.

In NESTLER System individually adjusted assessment e.g. Excel-Lists, graphs, statistics on the current progress of a project are available at any time online. Thus the project decision makers can -at a very early stage- intervene for collective action.

The structured data management, the precisely defined and permanently monitored production, quality and logistics processes, combined with the linking of all documents and components cause savings in time and cost of up to 30% per project.

NESTLER System is the most advanced project controlling solution currently available on the market, which is totally independent from a company's internal software solution.

This makes us the perfect partner for EPC/EPCM projects in international plant and steel construction.
